

ALUMINIUM RADIATORS

ALUMINIUM RADIATORS
Energy efficiency and style combined.

Aluminium radiators, whilst popular in Europe, have been long overlooked in the Australian hydronic heating market. With their clean minimal lines providing a contemporary design not only are Aluminium radiators stunningly stylish but due to the thermal properties of Aluminium they are also highly energy efficient and environmentally friendly.

Standard hydronic radiator panels are traditionally manufactured from steel, however, years of research and development by European manufacturers into utilising the thermal properties of Aluminium has seen a trend in Europe away from steel in favour of Aluminium.

ALUMINIUM RADIATORS

FEATURES OF ALUMINIUM RADIATORS

Aluminium is a very efficient material allowing heat to disperse quickly allowing aluminium radiators to be accurately controlled, further the very nature of Aluminium thermal properties means the radiators have a higher heat output and lower water content compared to standard steel panel radiators. Aluminium heats up and cools down quickly resulting in faster response times to temperature demands in comparison to standard steel panel radiators giving maximum performance for the minimum cost. Aluminium is non corrosive and there is the ability to recycle at the end of their lives. In fact some of the radiators sold by H2O Heating are made themselves from partially recycled Aluminium!

Aluminium radiators, with their clean minimal lines, provide a contemporary design blending well into any homes interior decor, available in powder coated white as standard, horizontal or vertical in a wide range of sizes and outputs; end panels are available to complete the minimalist look.

THE DESIGNER LOOK

To keep up with current demands in home decor the Vip & Oscar, long established favourites, are now available in 4 special powder coated finishes of textured light grey (as per the main image); textured black gold (see image below); polished silver (as per the Vip top right image on the front) and textured matt black.

Further still Italian Aluminium radiator manufacturers have been developing a range of designer Aluminium radiators which not only have the benefits of Aluminium's thermal properties but provide the wow factor to a room's interior.
